LIMITS AND CONTINUITY: Standard functions – Graphs - Limit - continuity - piecewise continuity - periodic - differentiable functions - Riemann sum - integrable functions - fundamental theorem of calculus

TEXT BOOKS:

1. Thomas G B Jr., Joel Hass, Christopher Heil, Maurice D Wier, Thomas' Calculus, Pearson Education, 2018.

Closed Interval

$f(x)$ defined $[a, b]$

for all $c \in (a, b)$

LHL = RHL = limit

$$\lim_{x \to c^-} f(x) = \lim_{x \to c^+} f(x) = \lim_{x \to c} f(x)$$

at $x = a$ (left end point)

$$\lim_{x \to a^+} f(x) = \lim_{x \to a} f(x)$$

at $x = b$ (right end point)

$$\lim_{x \to b^-} f(x) = \lim_{x \to b} f(x)$$

Remark:

For the existence of limit at $x = a$ (x approaches a (right or left)) the function may or may not be defined at $x = a$)

Open Interval

$f(x)$ defined over (a,b)

limits do not exists at end points $(a$ & $b)$

because a & b are not included in the domain

for all $c \in (a,b)$

LHL = RHL = limit

$$\lim_{x \to c^-} f(x) = \lim_{x \to c^+} f(x) = \lim_{x \to c} f(x)$$

Problem

H.W

greatest integer function

Evaluate (a) $\lim_{x \to 3^+} \frac{\lfloor x \rfloor}{x}$ (b) $\lim_{x \to 3^-} \frac{\lfloor x \rfloor}{x}$ $= \lim_{x \to 3^-} \frac{x-1}{x}$

$= \lim_{x \to 3^+} \frac{x}{x}$

$\lfloor 3.1 \rfloor = 3$

$= 1$

$= \frac{2}{3}$

$\lfloor 3.2 \rfloor = 3$

$\lfloor 2.9 \rfloor = 2$

$\lfloor 2.8 \rfloor = 2$

Continuity

Let c be a real number that is either an interior point or an endpoint of an interval in the domain of f. The function f is continuous at c if

LHL RHL

$$\lim_{x\to c^-} f(x) = \lim_{x\to c^+} f(x) = \lim_{x\to c} f(x) = f(c).$$

→ value of the function $f(x)$ at $x = c$

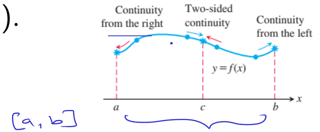
The function f is right-continuous at c (or continuous from the right) if

$$\lim_{x\to c^+} f(x) = f(c).$$

RHL =

The function f is left-continuous at c (or continuous from the left) if

$$\lim_{x\to c^-} f(x) = f(c).$$



Example Let $f(x) = \sqrt{4 - x^2}$. Find out the points at which $f(x)$ is left-continuous, right-continuous and continuous.

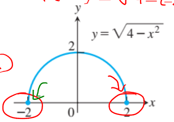
$f(2) = \sqrt{4-2^2} = \sqrt{4-4} = 0$

$f(-2) = \sqrt{4-(-2)^2} = 0$

$f(x)$ is left continuous at 2 $\left(\lim_{x \to 2^-} f(x) = f(2)\right)$ $0 = 0$

$f(x)$ is right continuous at -2 $\left(\lim_{x \to -2^+} f(x) = f(-2)\right)$ $0 = 0$

$f(x)$ is continuous $[-2, 2]$



Domain = $[-2, 2]$

end points are -2 & 2

left end   right end

Example Unit step function

$U(x) = \begin{cases} 1, & x \geq 0 \\ 0, & x < 0 \end{cases}$

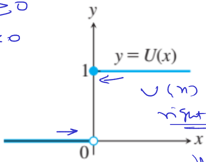
$\lim_{x \to 0^-} U(x) = 0$, $U(0) = 1$

$\lim_{x \to 0^-} U(x) \neq U(0) \Rightarrow U(x)$ is not left continuous

$\lim_{x \to 0^-} U(x) \neq \lim_{x \to 0^+} U(x) \Rightarrow$ limit does not exists at $x = 0$

$0 \neq 1$

$\Rightarrow U(x)$ is not continuous at $x = 0$



$U(x)$ is right continuous at $x = 0$

$\lim_{x \to 0^+} U(x) = U(0)$

$1 = 1$

Domain $(-\infty, \infty)$

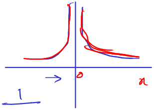
Range $\{0, 1\}$

function $U(x)$ is continuous in $\mathbb{R} - \{0\}$

Continuity Test

A function $f(x)$ is continuous at a point $x = c$ if and only if it meets the following three conditions.

- $f(c)$ exists (c lies in the domain of f)
- $\lim_{x\to c} f(x)$ exists (f has a limit as $x \to c$) $\Rightarrow$ $\lim_{x\to c^+} f(x) = \lim_{x\to c^-} f(x) = L$
- $\lim_{x\to c} f(x) = f(c)$ (the limit equals the function value)



$f(x) = \frac{1}{x^2}$

Domain $f = R - \{0\}$

$\lim_{x\to 0^+} f(x) = \infty$

$\lim_{x\to 0^-} f(x) = \infty$

limit does not exist

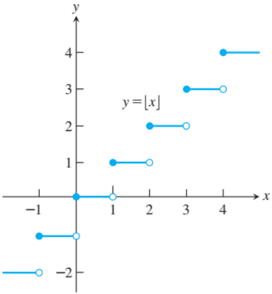
∞ is not a finite number

Greatest integer function (GIF)

GIF is continuous

at every non integer values

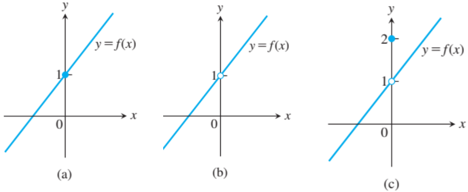
[0,1)

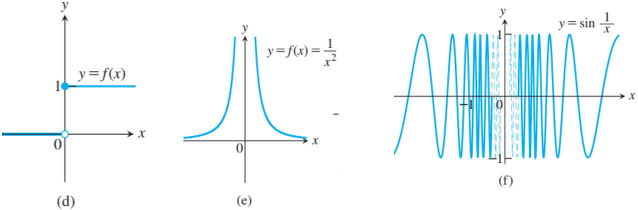


Domain(f) = $(-\infty,\infty)$

Types of discontinuity

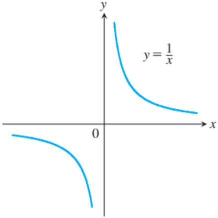
- Jump discontinuity
- Infinite discontinuity
- Oscillating discontinuity
- Removable discontinuity





Continuous function Continuous at every point.
Discontinuous function Discontinuous at one or more points of its domain.
Example

- $f(x) = \frac{1}{c}$.
- Identity function
- constant function



Properties of continuous functions

If the functions f and g are continuous at $x = c$, then the following algebraic combinations are continuous at $x = c$

- Sums: $f + g$
- Differences: $f - g$
- Constant multiples $k \cdot f$, for any number k
- Products: $f \cdot g$
- Quotients: f/g, provided $g(c) \neq 0$
- Powers: f^n, where n is the positive integer
- Roots: $\sqrt[n]{f}$, provided it is defined on an interval containing c, where n is a positive integer.

Problems

Polynomial functions, rational functions, $|x|$, $\sin x$, $\cos x$, $\tan x$.

Show that the following functions are continuous on their natural domains.
$(a)\ y = \sqrt{x^2 - 2x - 5}$ $\quad (b)\ y = \frac{x^{2/3}}{1+x^4}$ $\quad (c)\ y = \left|\frac{x-2}{x^2-2}\right|$

Theorem Limits of Continuous Functions
If $\lim\limits_{x\to c} f(x) = b$ and g is continuous at the point b, then

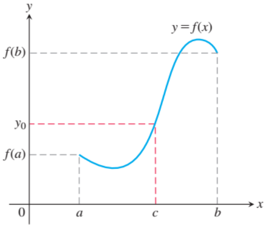
$$\lim_{x\to c} g(f(x)) = g(b).$$

Problem Evaluate

$$\lim_{x\to \frac{\pi}{2}} \cos\left(2x + \sin\left(\frac{3\pi}{2} + x\right)\right)$$

The Intermediate Value Theorem for Continuous Functions

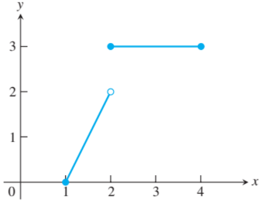
If f is a continuous function on a closed interval $[a, b]$, and if y_0 is any value between $f(a)$ and $f(b)$, then $y_0 = f(c)$ for some $c \in [a, b]$.



- Continuous functions over finite closed intervals have this property.
- Geometrically, the IVT says that any horizontal line $y = y_0$ crossing the y-axis between the numbers $f(a)$ and $f(b)$ will cross the curve $y = f(x)$ at least once over the interval $[a, b]$.
- The proof of IVT depends on the completeness property.
- The completeness property implies that $\mathbb{R}$ have no holes or gaps while $\mathbb{Q}$ do not satisfy the completeness property.

A Consequence for Graphing: Connectedness

- IMVT implies that the graph of a function that is continuous on an interval cannot have any breaks over the interval.
- It will be connected - a single, unbroken curve.
- It will not have jumps such as the ones found in the graph of the greatest integer function, or separate branches as found in the graph of $1/x$.



$$f(x) = \begin{cases} 2x - 2, & 1 \le x < 2 \\ 3, & 2 \le x \le 4 \end{cases}$$

does not take on all values between $f(1) = 0$ and $f(4) = 3$; it misses all the values between 2 and 3.

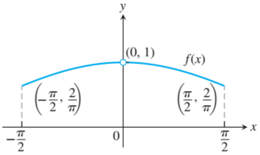
A Consequence for Root Finding

- We call a solution of the equation $f(x) = 0$ a root of the equation or zero of the function f.
- The Intermediate Value Theorem tells us that if f is continuous, then any interval on which f changes sign contains a zero of the function.
- Somewhere between a point where a continuous function is positive and a second point where it is negative, the function must be equal to zero

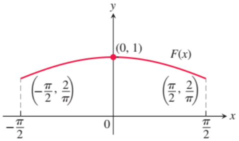
Problem Show that there is a root of the equation $x^3 - x - 1 = 0$ between 1 and 2.

Continuous extension to a point

Example $f(x) = \frac{\sin x}{x}$.



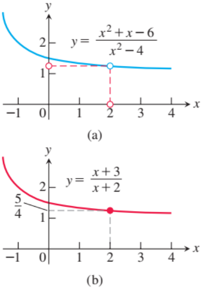
(a)



(b)

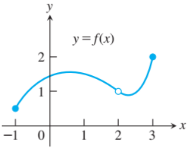
Problem Show that

$$f(x) = \frac{x^2 + x - 6}{x^2 - 4}, \; x \neq 2.$$

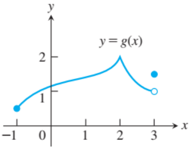


Check whether the functions graphed below are continuous on [-1,3]?
If not, give reasons.

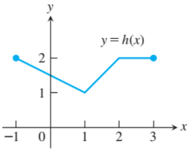
1.



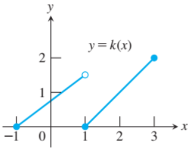
2.



3.

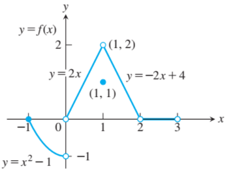


4.



$$f(x) = \begin{cases} x^2 - 1, & -1 \le x < 0 \\ 2x, & 0 < x < 1 \\ 1, & x = 1 \\ -2x + 4, & 1 < x < 2 \\ 0, & 2 < x < 3 \end{cases}$$

graphed in the accompanying figure.



The graph for Exercises 5–10.

5. **a.** Does $f(-1)$ exist?

b. Does $\lim_{x\to -1^+} f(x)$ exist?

c. Does $\lim_{x\to -1^+} f(x) = f(-1)$?

d. Is f continuous at $x = -1$?

6. **a.** Does $f(1)$ exist?

b. Does $\lim_{x\to 1} f(x)$ exist?

c. Does $\lim_{x\to 1} f(x) = f(1)$?

d. Is f continuous at $x = 1$?

7. **a.** Is f defined at $x = 2$? (Look at the definition of f.)

b. Is f continuous at $x = 2$?

8. At what values of x is f continuous?

9. What value should be assigned to $f(2)$ to make the extended function continuous at $x = 2$?

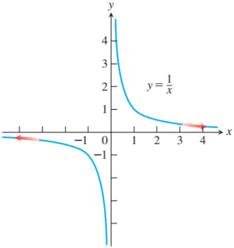
10. To what new value should $f(1)$ be changed to remove the discontinuity?

Limits Involving Infinity; Asymptotes of Graphs

Behavior of a function when the magnitude of the independent variable x becomes increasingly large, or $x \to \pm\infty$. We further extend the concept of limit to infinite limits.

Finite Limits as $x \to \pm\infty$

Example $f(x) = \frac{1}{x}$.



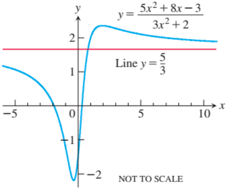
Evaluate $\lim_{x \to \infty} \left(5 + \frac{1}{x}\right)$.

Limits at Infinity of Rational Functions

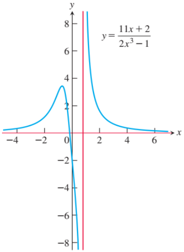
To determine the limit of a rational function as $x \to \pm\infty$, we first divide the numerator and denominator by the highest power of x in the denominator. The result then depends on the degrees of the polynomials involved.

Examples

(a) $\lim_{x\to\infty} \frac{5x^2+8x-3}{3x^2+2}$



(b) $\lim_{x\to-\infty} \frac{11x+2}{2x^3-1}$



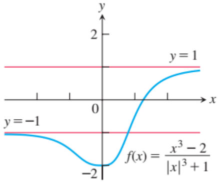
Horizontal Asymptotes

Definition A line $y = b$ is a horizontal asymptote of the graph of a function $y = f(x)$ if either

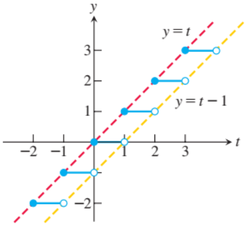
$$\lim_{x \to \infty} f(x) = b \quad \text{or} \quad \lim_{x \to -\infty} f(x) = b$$

Problem Find the asymptotes of the graph of

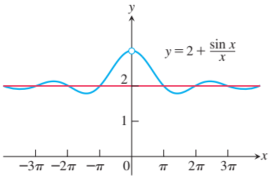
$$f(x) = \frac{x^3 - 3}{|x|^3 + 1}.$$



Problem Find $\lim_{x \to 0^+} x \left\lfloor \frac{1}{x} \right\rfloor$



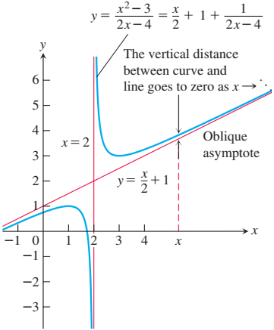
Problem Using the Sandwich Theorem, find the horizontal asymptote of the curve $y = 2 + \frac{\sin x}{x}$.



Oblique Asymptotes

- If the degree of the numerator of a rational function is 1 greater than the degree of the denominator, the graph has an oblique or slant line asymptote.
- We find an equation for the asymptote by dividing numerator by denominator to express f as a linear function plus a remainder that goes to zero as $x \to \pm\infty$.

Problem Find the oblique asymptote of $f(x) = \frac{x^2-3}{2x-4}$.



Vertical Asymptotes

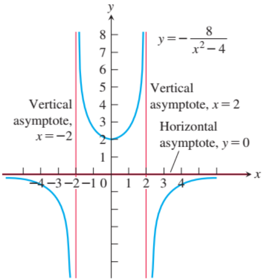
A line $x = a$ is a vertical asymptote of the graph of a function $y = f(x)$ if either

$$\lim_{x \to a^+} f(x) = \pm\infty \quad \text{or} \quad \lim_{x \to a^-} f(x) = \pm\infty$$

Problem Find the horizontal and vertical asymptotes of the curve $y = \frac{x+3}{x+2}$.

Problem

Find the horizontal and vertical asymptotes of the curve $y = -\frac{8}{x^2-4}$.



Finding Limits

1. For the function f whose graph is given, determine the following limits.

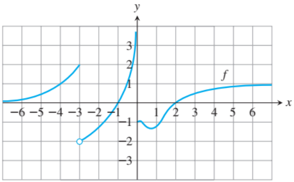
a. $\lim_{x \to 2} f(x)$ **b.** $\lim_{x \to -3^+} f(x)$

c. $\lim_{x \to -3^-} f(x)$ **d.** $\lim_{x \to -3} f(x)$

e. $\lim_{x \to 0^+} f(x)$ **f.** $\lim_{x \to 0^-} f(x)$

g. $\lim_{x \to 0} f(x)$ **h.** $\lim_{x \to \infty} f(x)$

i. $\lim_{x \to -\infty} f(x)$



2. For the function f whose graph is given, determine the following limits.

a. $\lim_{x\to 4} f(x)$	**b.** $\lim_{x\to 2^+} f(x)$	**c.** $\lim_{x\to 2^-} f(x)$
d. $\lim_{x\to 2} f(x)$	**e.** $\lim_{x\to -3^+} f(x)$	**f.** $\lim_{x\to -3^-} f(x)$
g. $\lim_{x\to -3} f(x)$	**h.** $\lim_{x\to 0^+} f(x)$	**i.** $\lim_{x\to 0^-} f(x)$
j. $\lim_{x\to 0} f(x)$	**k.** $\lim_{x\to \infty} f(x)$	**l.** $\lim_{x\to -\infty} f(x)$
